① a) $\lambda \models \varphi R \psi$ iff $(\exists i \geq 0. \lambda[i \dots \infty] \models \varphi \text{ and } \forall j, 0 \leq j \leq i, \lambda[j \dots \infty] \models \psi)$
or
 $(\forall j \geq 0. \lambda[j \dots \infty] \models \psi)$

b) $\varphi R \psi = G \psi \vee (\psi \vee (\varphi \wedge \psi))$

c) $\lambda \models \varphi R \psi \Leftrightarrow \lambda \models G \psi \vee (\psi \vee (\varphi \wedge \psi)) \Leftrightarrow \lambda \models G \psi \text{ or } \lambda \models \psi \vee (\varphi \wedge \psi)$

$\Leftrightarrow (\forall j \geq 0. \lambda[j \dots \infty] \models \psi) \text{ or } (\exists i \geq 0. \lambda[i \dots \infty] \models \varphi \wedge \psi \text{ and } \forall j. 0 \leq j < i$
s.t. $\lambda[j \dots \infty] \models \psi) \Leftrightarrow (\forall j \geq 0. \lambda[j \dots \infty] \models \psi) \text{ or } (\exists i \geq 0. \lambda[i \dots \infty] \models \varphi$
and $\lambda[i \dots \infty] \models \psi \text{ and } \forall j. 0 \leq j < i. \lambda[j \dots \infty] \models \psi) \Leftrightarrow$

$\Leftrightarrow (\forall j \geq 0. \lambda[j \dots \infty] \models \psi) \text{ or } (\exists i \geq 0. \lambda[i \dots \infty] \models \varphi \text{ and } \forall j. 0 \leq j \leq i. \lambda[j \dots \infty] \models \psi)$

d) $\perp R \psi \equiv G \psi \vee (\psi \vee (\perp \wedge \psi)) \equiv G \psi \vee (\psi \vee \perp) \equiv G \psi \vee \perp \equiv G \psi$

② " \Leftarrow " ~~that~~ (M, t) and (M', t') satisfy the same CTL* formulas. Assume (M, t) satisfies some CTL formula ϕ that (M', t') does not. By 5(a), $\exists \phi'$ a CTL* formula such that is equivalent to ϕ . So (M, t) satisfies ϕ' , but by our assumption, (M', t') satisfies ϕ' . So (M', t') satisfies ϕ & (same for why (M', t') does not satisfy any different CTL formula)
" \Rightarrow " (M, t) and (M', t') satisfy the same CTL formulas, then by ⑦, (M, t) is bisimilar to (M', t') . Since the truth of CTL* formulas is preserved by bisimulation (by ⑥), (M, t) & (M', t') satisfy the same CTL* formulas

This interesting result shows that any two models that express the same CTL formulas ~~have~~ cannot express different CTL* formulas, even though mostly because the additional syntax and semantics don't account for any choice of w.r.t. the truth of formulas that is determined through atom valuations.

3

a) Consider the syntax for CTL state formulas:

$$\phi = a \mid \neg \phi \mid \phi \wedge \phi \mid EX\phi \mid AX\phi \mid E(\phi \cup \phi) \mid A(\phi \cup \phi)$$

Will show that CTL is a syntactic fragment of CTL* by structural induction on state formulas:

Case $\phi = a \mid \neg \phi \mid \phi \wedge \phi$. Then ϕ is also a CTL* formula, as this 3 cases are exactly as in the def. of state formulas in CTL*.

Case $\phi = EX\phi_1$. Then $\phi = EX\phi_1 = E\gamma = \phi_{CTL*}$, since ϕ_1 is a CTL* formula (by ind. hypothesis) and $X\phi_1$ is in the syntax of CTL* path formulas (γ is a path formula).

Case $\phi = AX\phi_1$. Then $\phi = AX\phi_1 = A\gamma = \phi_{CTL*}$ by the same argument as above (analogue).

Case $\phi = E(\phi_1 \cup \phi_2)$. Then $\phi = E\gamma = \phi_{CTL*}$ by the fact that ϕ_1 & ϕ_2 are CTL* formulas (ind. hypothesis) and $\phi_1 \cup \phi_2$ is in the syntax of CTL* path formulas.

Case $\phi = A(\phi_1 \cup \phi_2)$ similarly as above.

Those are all the possible cases. Induction is complete. \square

b) $EXXp$ is a formula in CTL* but not in CTL (where p is an atom): In CTL, we cannot have consecutive 'X'.

②

i) $(M, g) \models E \neg \phi \Leftrightarrow (M, g) \models E(\text{true} \cup \phi) \stackrel{\text{def}}{\Leftrightarrow}$ for some path λ starting from g , $(M, \lambda) \models \text{true} \cup \phi \Leftrightarrow$ for some path λ starting from g , for some $j \geq 0$, $(M, \lambda[j]) \models \phi$ and for all i s.t. $0 \leq i < j$, $(M, \lambda[i]) \models \text{true} \stackrel{(*)}{\Leftrightarrow}$ for some path λ starting from g , for some $j \geq 0$, $(M, \lambda[j]) \models \phi$ \square

ii) $(M, g) \models A \neg \phi \Leftrightarrow (M, g) \models A(\text{true} \cup \phi) \stackrel{\text{def}}{\Leftrightarrow}$ for all paths λ starting from g , $(M, \lambda) \models \text{true} \cup \phi \Leftrightarrow$ for all paths λ starting from g , for some $j \geq 0$, $(M, \lambda[j]) \models \phi$ and for all i s.t. $0 \leq i < j$, $(M, \lambda[i]) \models \text{true} \stackrel{(*)}{\Leftrightarrow}$ for ~~no~~ paths λ starting from g , for some $j \geq 0$, $(M, \lambda[j]) \models \phi$

iii) $(M, g) \models EG \phi \Leftrightarrow (M, g) \models \neg A \neg \neg \phi \stackrel{\text{def}}{\Leftrightarrow} (M, g) \not\models A \neg \neg \phi$

$\stackrel{\text{ii)}}{\Rightarrow}$ it is not the case that for all paths λ starting from g , for some $j \geq 0$, $(M, \lambda[j]) \models \neg \phi \Leftrightarrow$ for some λ starting from g , for ~~some~~ $j \geq 0$, $(M, \lambda[j]) \not\models \neg \phi \Leftrightarrow$ for some λ starting from g , for ~~some~~ $j \geq 0$, $(M, \lambda[j]) \models \phi$ \square

iv) $(M, g) \models AG \phi \Leftrightarrow (M, g) \models \neg E \neg \neg \phi \stackrel{\text{def}}{\Leftrightarrow} (M, g) \not\models E \neg \neg \phi$
 $\stackrel{\text{i)}}{\Rightarrow}$ it is not the case that for ~~some~~ path λ from g , for some $j \geq 0$, $(M, \lambda[j]) \models \neg \phi \Leftrightarrow$ for all λ from g , for all $j \geq 0$, $(M, \lambda[j]) \not\models \neg \phi \Leftrightarrow$ for all λ from g , for all $j \geq 0$, $(M, \lambda[j]) \models \phi$

Note: $(*)$ is using the facts that $A \wedge T \equiv A$ and $(M, \lambda[i]) \models \text{true}$ for any i and any M, λ .

④ Restricting Def 2 to CTL means we no longer have the rules for path formulas that are not syntactically path formulas in CTL. Thus, we drop the following rules:

$$(M, \pi) \models \phi \text{ iff } \dots$$

$$(M, \pi) \models \neg \psi \text{ iff } \dots$$

$$(M, \pi) \models \psi \wedge \psi$$

The state formulas are the same as in Def 1.7, so they're unchanged.

$$(M, s) \models \neg$$

$$(M, s) \models \neg \phi$$

$$(M, s) \models \phi \wedge \phi'$$

$$(M, s) \models E \psi$$

$$(M, s) \models A \psi.$$

We note that in Def 2, $(M, \pi) \models X\psi$ holds only if we can prove ψ . ψ is a state formula, so it can only be proved by the state rules (i.e. ones above & in Def 1.7).

Thus for $X\psi$, we only need the first state, $\pi[1]$, to prove ψ . So $(M, \pi) \models X\psi$ is the same as in Def 1.8.

For a similar reason, $(M, \pi) \models \psi \vee \psi'$ has to be the same as in Def 1.8. The restriction is completed.

⑤ b) Consider $A(\text{true} \cup (a \wedge Xa))$ a CTL* formula.
This formula is equivalent to $\neg F(a \wedge Xa)$ in LTL:

$M \models \neg F(a \wedge Xa) \stackrel{\text{LTL}}{\underset{\text{Def 1.5}}{\Leftrightarrow}} (M, g_0) \models \neg F(a \wedge Xa)$ for every (initial) state g_0 in $M \stackrel{\text{LTL}}{\underset{\text{Def 1.5}}{\Leftrightarrow}}$ for arb. init state g_0 , for every path λ in M where $\lambda[0] = g_0$, $\lambda \models \neg F(a \wedge Xa)$
 \Leftrightarrow for every λ in M where $\lambda[0] = g_0$, $\lambda \models \neg F(a \wedge Xa)$
 $\Leftrightarrow \neg \text{---} \text{---} \text{---}$, $(\exists) i \geq 0$, s.t. $\lambda[i \dots \infty] \models a \wedge Xa$
 ~~$\Leftrightarrow \neg \text{---} \text{---} \text{---}$, ~~$\text{---} \text{---} \text{---}$~~ , s.t. $\lambda[i \dots \infty] \models a$ and $\lambda[i \dots \infty] \models Xa$~~
 ~~$\Leftrightarrow \neg \text{---} \text{---} \text{---}$, ~~$\text{---} \text{---} \text{---}$~~ , s.t. $\lambda[i \dots \infty] \models a$ and $\lambda[i \dots \infty][1 \dots \infty] \models a$~~
 ~~$\Leftrightarrow \neg \text{---} \text{---} \text{---}$, ~~$\text{---} \text{---} \text{---}$~~ , s.t. $\lambda[i \dots \infty] \models a$ and $\lambda[i+1 \dots \infty] \models a$~~
 $\Leftrightarrow \neg \text{---} \text{---} \text{---}$, s.t. M
 $\Leftrightarrow \neg \text{---} \text{---} \text{---}$, $(M, \lambda) \models \text{true} \cup (a \wedge Xa)$
 $\Leftrightarrow (M, g_0) \models A(\text{true} \cup (a \wedge Xa))$, for all paths starting from g_0 .

But since $\neg F(a \wedge Xa)$ has no equivalent formula in CTL, then " $A(\text{true} \cup (a \wedge Xa))$ " has no equivalent. \square

a) Consider an arbitrary formula in CTL. Take an arbitrary model and a state, $M \& \triangleright$, s.t. $(M, \triangleright) \models \phi$. Since CTL is a syntactic fragment of CTL*, we can consider $\phi' = \phi$, where ϕ' is a CTL* formula. Then $(M, \triangleright) \models \phi'$, because in order to show $(M, \triangleright) \models \phi'$, we only need the semantic rules of CTL* restricted to CTL & replicate the proof for $(M, \triangleright) \models \phi$ in CTL. Thus for every CTL formula we have an equivalent formula (itself).

⑥ We will show by structural induction on the following:

$(M, f) \models \phi \text{ iff } (M', f') \models \phi$, for arbitrary M, M' models,

f, f' states or paths (both of the same type) and $(M, f) \approx (M', f')$

→ Case $\phi = \uparrow$. $(M, t) \models \uparrow \Leftrightarrow t \in V(\uparrow) \xLeftrightarrow[\text{B is a bisim. \& (a)}] t' \in V'(\uparrow) \Leftrightarrow (M', t') \models \uparrow. \square$

→ Case $\phi = \neg \psi$. $(M, t) \models \neg \psi \stackrel{\text{def}}{\Leftrightarrow} (M, t) \not\models \psi \xLeftrightarrow[\text{Ind. Hypothesis}] (M', t') \not\models \psi \Leftrightarrow (M', t') \models \neg \psi.$

→ Case $\phi = \phi_1 \wedge \phi_2$. $(M, t) \models \phi_1 \wedge \phi_2 \Leftrightarrow (M, t) \models \phi_1 \text{ and } (M, t) \models \phi_2 \Leftrightarrow \stackrel{\text{Ind. Hyp.}}{\Leftrightarrow} (M', t') \models \phi_1 \text{ and } (M', t') \models \phi_2 \Leftrightarrow (M', t') \models \phi_1 \wedge \phi_2. \square$
Applied twice

→ Case $\phi = E\psi$. We'll show " $(M, t) \Rightarrow (M', t')$ " and " \Leftarrow " is going to be similar (with the difference that we'll use the back property instead of the forth):

$(M, t) \models E\psi \Rightarrow$ for some path π_E starting from t , we have $(M, \pi_E) \models \psi$. Let $\pi_E[i] \stackrel{\text{not}}{=} t_i, \forall i \geq 1$. By applying the forth property, we know that $\exists t'_1 \text{ s.t. } t \rightarrow t'_1 \ \& \ B(t_1, t'_1)$ (since $B(t, t') \ \& \ t \rightarrow t_1$). By doing this countably many times, we obtain the states t'_1, t'_2, \dots s.t. $B(t_i, t'_i), \forall i \geq 1$.

Then we have a path $\pi'_E = [t', t'_1, \dots]$ in M' s.t. $(M', \pi'_E) \approx (M, \pi_E)$.

By Ind. hypothesis, we have obtained a path π'_E starting from t' such that $(M', \pi'_E) \models \psi$. Thus by definition, $(M', t') \models E\psi$.

→ Case $\phi = A\psi$ is argued similarly as the previous case.

→ Cases $\phi = \psi, \psi \wedge \psi, \neg \psi$ for (M, π) are argued similarly as the cases for state formulas above.

→ Case $\phi = X\psi$. $(M, \pi) \models X\psi \Leftrightarrow (M, \pi[1.. \infty]) \models \psi \xLeftrightarrow[\text{Ind Hypothesis and (*)}] (M', \pi'[1.. \infty]) \models \psi \Leftrightarrow (M', \pi') \models X\psi$

Where (*): $(M, \pi) \approx (M', \pi') \Leftrightarrow \forall i \geq 0. (M, \pi[i]) \approx (M', \pi'[i]) \xRightarrow{\text{Ind Hypothesis}} \forall i \geq 1.$

→ Case $\phi = \psi \vee \psi'$ follows from applying (*) and Ind Hypothesis twice.
Those are all cases, thus induction is complete. \square

⑦ (a) holds, since t & t' are CTL-equivalent, so they satisfy the same atoms. \square

(\Leftarrow forth) Take $v \in St$ such that $t \rightarrow v$.

If there are no paths starting from t , then $(M, t) \models \neg ET$ so $(M', t') \not\models \neg ET$, so there are no paths starting from t' either. Then, in both models, we can only construct formulas with \neg , \wedge , and atoms & bisimilarity is proven similarly to ~~them~~ 35.

If there is a path from t , consider the path π s.t. $\pi[0] = t$ & $\pi[1] = v$. Then $(M, \pi) \models XT$ holds, for any π' s.t. $\pi'[0] = t'$ (modally equivalence). This implies that $\exists v'$ s.t. $t' \rightarrow v'$ & $\pi'[1] = v'$ & exists a path π' starting from t' .

Now, for contradiction, assume that for no $v_i' \in St'$ with $t' \rightarrow v_i'$, we have $(M, v) \& (M', v')$ CTL-equivalent.

Then, for each v_i' there \exists a formula ϕ_i s.t.

$(M, v) \models \phi_i$ & $(M', v') \not\models \phi_i$. Then, $(M, \pi) \models X(\phi_1 \wedge \phi_2 \wedge \dots)$

but $(M', \pi') \not\models X(\phi_1 \wedge \dots)$. Thus we have a contradiction with t & t' being CTL-equiv. \square

(\Leftarrow back) Similarly as above. \square
